INTRODUCTION

The Internal Revenue Service 1983 Tax Model File (122,889 records) was selected as part of the Statistics of Income program that was designed to tabulate and present statistical information for the 96,321,310 Form 1040, Form 1040A, and Form 1040EZ Federal Individual Income Tax Returns filed for Tax Year 1983.

The Tax Model files which have been produced since 1960 consist of detailed information taken from actual tax returns. The public use versions of these sample files are purchased in an unidentifiable form, with names, Social Security Numbers (SSN), and other similar information omitted. The primary uses made of these files have been to simulate the administrative and revenue impact of tax law changes, as well as to provide general statistical tabulations relating to sources of income and taxes paid by individuals.

The Individual Tax Model File is designed for making national level estimates. The 1983 Tax Model File can be purchased through the Internal Revenue Service, Statistics of Income Division. Any questions concerning the

Dr. Fritz Scheuren, Director Statistics of Income Division D:R:S Internal Revenue Service 1111 Constitution Ave., N.W. Washington, D.C. 20224 (202) 376-0216

In order to preserve the character of the microdata file while also protecting the identity of individuals, we have incorporated the following procedure changes in the Individual Tax Model.

First, the entire file has been sorted from largest to smallest for the

Third, for records with adjusted gross income (absolute value) of less than \$200,000, motor vehicle and general sales tax deductions have also been combined and placed in the field for general sales tax deductions, and then these records have been sorted by state. After this sort, the records have been modified for general sales tax, state and local income tax, real estate tax, personal property tax deductions and wages and salaries in the same manner as described above. The only difference between these records and those with returns having adjusted gross income (absolute value) of \$200,000 or more is that records with adjusted gross income (absolute value) of less than \$200,000 have been sorted for each field by individual state with no records from two different states being combined when averaging a field over a series of records.

Fourth, the fields containing total miscellaneous, other net income less loss, total tax liability and total taxes paid deductions have been deleted and marked as "reserved." Also, all fields on the file have been rounded to the four most significant digits (e.g. \$14,371 = \$14,370 and \$228,867 = \$228,900).

Individual Tax Model Files for each of the Tax Years 1966 through 1978, and State Tax Model Files for Tax Years 1977 and 1978, are available through the National Archives and Records Service. Questions concerning cost, acquisition, and delivery of these historical tax model files, should be addressed to:

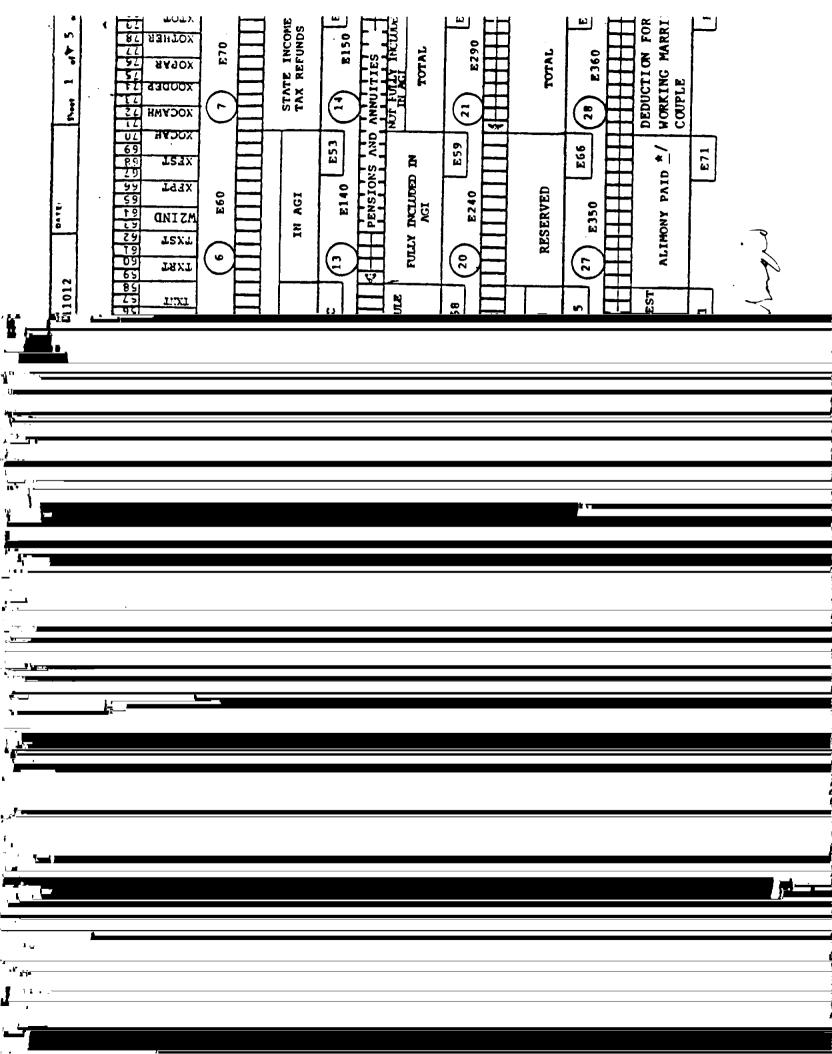

Macnine Readable Archives Division National Archives and Records Service General Services Administration Washington, D.C. 20408 (202) 523-4887

The Archives order number for any of the above-mentioned historical Tax Model files is 374-109-(A). In addition to the order number, the requestor should also specify the tax year and version (Individual or State) of the file under consideration.

Please refer to the sections of this booklet titled "Individual Tax Model Sample Description" for a more detailed discussion of the Tax Model file.

EXPLANATIONS OF ELEMENTS IN THE TAPE FILES

EXPLANATIONS OF ELEMENTS IN THE TAPE FILES

The following explanations define data elements contained in 1983

Individual Tax Model File that have not been abstracted directly from a specific line on Forms 1040, 1040A, 1040EZ or the accompanying Schedules and Forms. Element numbers not appearing in this section have been entered on the specific lines on the forms or schedules from which the data were abstracted. Refer to the "1983 Federal Tax Forms" section of this booklet for further information.

Element Number	<u>Definition</u> •
37	Zero Bracket Amount This amount was limited to the smaller of the statutory limit or Taxable Income (E39).
38	Taxable Income, Old Concept This is a computed amount equal to Adjusted Gross Income minus (Zero Bracket Amount or Total Itemized Deductions) minus Exemption Amount, but never less' than zero. This concept does not include the Zero Bracket Amount, and as such is comparable to taxable income as shown for Tax Years prior to 1977. See (E39).
39	Taxable Income, New Concept This is a computed amount equal to Adjusted Gross Income minus Excess Itemized Deductions (or plus unused Zero Bracket Amount) minus Exemption Amount. This concept includes the Zero Bracket Amount (Equivalent of the former Standard Deduction) and is thus not comparable to taxable income as shown for Tax Years prior to 1977. See (E70).
41	Computed Regular Tax This is a computed amount arrived at by applying the tax rate schedules to taxable income, without regard to the type of computation used by the taxpayer.
43	Income Subject to Tax (Old Concept) Income Subject to Tax (NEW Concept) minus the Zero Bracket Amount.

Element Number	Definition
44	Income Subject to Tax (New Concept) For taxpayers using the regular, alternative, or maximum tax computation methods, income subject to tax was the same as taxable income. For taxpayers using the income averaging method (Schedule G), income subject to tax was a reduced amount of taxable income computed for the statistics by working backwards from the tax itself.
4 5	Marginal Tax Base This is the amount of income subject to tax at the highest tax rate applicable to the return (TXRT).
54	Earned Income Credit Used to Offset Income Tax Before Credits This amount was computed based on the lesser of: Earned Income Credit (E75) or Income Tax Before Credits minus all credits except the Earned Income Credit.
56	Total Tax Credits Total credits from Form 1040 or 1040A plus the amount of Earned Income Credit used to offset Income Tax before Credits.
58	Total Income Tax Element (59) plus element (60) plus element (61).
59	Income Tax After Credits Income Tax after Credits from Form 1040 or 1040A minus the amount of Earned Income Credit used to offset income tax before credits.
66	Total Tax Payments Total payments from 1040 or 1040A minus the total Earned Income Credit.
76	Earned Income Credit (Salaries and Wages) The total amount of salaries and wages which have been revised in computing the Earned Income Credit on returns with an Earned Income Credit.
77	Earned Income Credit (Earned Income) The amount of net earnings from self-employment used in computing the Earned Income Credit.
78-79	IF Earned Income Credit (E20) is greater than Income Tax Before Credits (E42), the following fields are computed:
	78 - Earned Income Credit used to offset all other taxes. This value depends on whether the difference between EIC (E75) and EIC used to offset Income Tax Before Credit (E59) is less than the value calculated by Total Tax Liability minus Income Tax After Credits minus Advance Earned Income Credit payments. IF it is less than this value, this field equals E75 minus E54. Also, E79 equals 0. IF this is not true, this field equals the value

calculated by Total Tax Liability minus Income Tax After Credits minus Advance Earned Income Credit payments. Also, E79 is calculated (see below).

- 79 Earned Income Credit Refundable Portion This equals E75 minus E54 minus E78 (see above for definitions and conditions).
- Advance Earned Income Credit payments in excess of EIC.
 This field is the difference between Advance EIC payments and EIC (E75).
- Additional Losses Due to Pre-1970 Carryover.

 See Form 4798, Line 30. If Line 30, Form 4798 exceeds Line 19 of Schedule D. this is the value.
- 119 Combined Capital Gains (Excluded Long-Term Gains).

 Sum of Line 22, Schedule D and 1.5 times Line 14, Form 1040.
- 120 Combined Capital Gains (combined net Capital Gain Less Loss).
 Sum of Line 19, Schedule D, plus 2.5 times Line 14, Form 1040.
- Combined Capital Gains (combined Long-Term Gains Included in AGI).

 If Net Short-Term Capital Gain are positive, the difference between Line 19, Schedule D and Excluded Long-Term Gains (El19 above).

 If Net Short-Term Capital Loss, subtract Line 8, Schedule D from above.

159- Weight:

- 160
- (a) Decimal A method of estimation by dividing the computer population count of returns in a sample stratum by the number of sample returns for that stratum (carried to 2 decimal places) The decimal place is implied. If used, divide by 100.
- (D) Integer A method of estimation in which the decimal weight is converted to an integer weight and then applied to each return.

TECHNICAL DESCRIPTION OF THE FILE

TECHNICAL DESCRIPTION OF THE FILES

Each "data record" in the file, representing one tax return, is composed of 1680 characters. Blocks are made up of 6 data records and are separated by a 3/4 inch "inter record gap" (IRG). There is no special indication at the end of a block other than the IRG, and no indication of the end of a data record.

Tape characters are recorded in either Interchange or EBCDIC on standard 2,400 foot, 1/2 inch, nine-track tape, and a density of 6250 bytes per inch (BPI). In this mode, a 1-bit and 0-bit are recorded as signals of opposite polarity in ODD parity (a parity bit is set to 1 or 0 so that there is always an ODD number of 1-bits in a nine-bit character).

Each code and data field is numeric and defined in character format. All codes are unsigned. The data fields are signed positive or negative, whichever is appropriate, in the last character position of the field.

Codes are defined as 2 characters in length. The largest decimal value is 99 with leading zeroes. The fields in the file are 10 characters in length with leading zeroes. Weight factors are provided to accommodate either a decimal or an integer weighting system.

The file is a single data set on multiple volumes and is UNLABELLED (EBCDIC) or LABELLED (Interchange).

INDIVIDUAL TAX MODEL SAMPLE DESCRIPTION

Sources of the Data

The data in the 1983 Individual Tax Model file were compiled from a stratified probability sample of unaudited individual income tax returns, Forms 1040, 1040A, and 1040EZ, filed by U.S. citizens and residents. The sample was designated at the National Computer Center and was processed in each of the ten Internal Revenue Service Centers during Calendar Year 1984. The total sample of 122,889 returns was selected from a population of 96,321,310 returns.

The estimates that could be obtained from this file are intended to represent all returns filed for Income Year 1983. While most of the returns processed during 1984 were for Calendar Year 1983, a few were for prior years. Returns for prior years were used in place of 1983 returns received and processed after December 31, 1984. This was done on the assumption that the characteristics of returns not yet filed could best be represented by the returns for previous income years that were processed in 1984.

All returns processed during 1984 were subjected to sampling except tentative and amended returns. Tentative returns were not subjected to sampling because the revised returns may have been sampled later on, while amended returns were excluded because the original returns had already been subjected to sampling.

Sample Criteria and Selection

Form 1040, 1040A and 1040EZ returns filed and processed into the Internal Revenue Service's Individual Master File System at NCC during 1984 were stratified, by computer, into sample strata based on: the presence or absence of a Schedule C, Profit (or Loss) from Business or Profession; presence of Schedule F, Profit (or Loss) from Farms; the larger of total income or loss, and the size of business plus farm receipts; size of adjusted gross income (or deficit) or largest of specific income (or loss) items. Returns were then selected from the sample strata using the coding digits of the Social Security Number (SSN) at rates ranging from 0.03 percent to 100 percent.

Method of Estimation

Sampling weights were obtained by dividing the computer population count of returns filed per sample stratum by the number of sample returns actually received for that stratum. All decimal sampling weights were then converted to "integer weighting factors," which were placed on each sample return. For example, if a decimal weight of 44.24 was computed for a stratum, 24 percent of the sample returns in the stratum were systematically given a weighting factor of 45, and 76 percent a weight of 44. The file can be weighted with either decimal or integer weights.

Processing and Management of the Sample

While the sample was being selected, the selection process was monitored by applying prescribed sampling rates for each stratum to the population count for that stratum. A follow-up was required to reconcile differences between the actual number of returns selected and the expected number.

In transcribing and tabulating the information from the returns in the sample, checks were imposed to improve the quality of the resulting estimates. Incorrect or missing entries on the sampled record were altered during statistical editing to make them consistent with other entries on the return and accompanying schedules. Data were also adjusted during editing in an attempt to achieve consistent statistical definitions. For example, a taxpayer may report director's fees on the other income line of the Form 1040 return. If this situation had been detected during statistical editing, the amount of director's fees would have been entered into the salaries and wages field to the sample record.

Quality of the basic data abstracted was controlled at the processing centers by means of a continuous verification system that used computer tests to check for mathematical errors and inconsistencies in the data. These tests were performed while the returns were still available to aid in resolving the error conditions. Prior to tabulation of the data at the IRS Data Center, additional computer tests were applied to each return record to determine the need for adjustments to the data. Also, as a further check on processing, the IRS Data Center conducted an independent reprocessing of a small subsample of the returns previously processed for the study.1/

^{1/} For more details on the techniques used to process the returns in the sample, particularly those steps designed to ensure the quality of the statistical data, see:
