PRELIMINARY DRAFT

Abstract

We estimate the effects of parental incarceration on youth crime, childbearing, and educational attainment using exogenous variation from the random assignment of judges in the Swedish court system. Our approach allows us to recover the causal effects of parental incarceration for cases where judges disagree on the appropriate sentence. The incarceration of a parent in childhood has no detectable impact on educational attainment, but leads to a significant increase in teen criminal behavior and, for females, teen childbearing. We find suggestive evidence that these effects are driven by lower parental earnings, higher parental welfare receipt, and a lower probability of living with both biological parents.

*We thank Leah Platt Boustan, Hank Farber, Ilyana Kuziemko, Alex Mas, Crystal Yang, and numerous seminar participants for helpful comments and suggestions. Kevin DeLuca and Amy Wickett provided excellent research assistance.
