Human Prosecutors

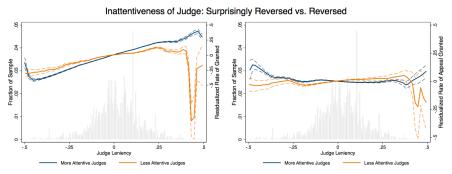

- Distribution of risk scores for released defendants is similar for most lenient and least lenient prosecutors.
- Are the lenient asylum judges, only denying the 'riskiest' applicants
 - ▶ i.e., seeing the lowest reversal rates (of their asylum denials)?

See also Kleinberg, Lakkaraju, Leskovec, Ludwig, Mullainathan, Quarterly J Econ 2017

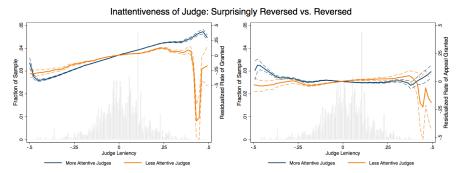

Left Figure: Judges have strong habits

A judge who is generally lenient in other cases is likely to be lenient in a given case

(Time window: 3 monthly periods pooled together before/after shock. More attentiveness: the coefficient of interaction of surprisingly reversed dummy and time-period dummy is bigger)

Right Figure: Assess implicit risk ranking

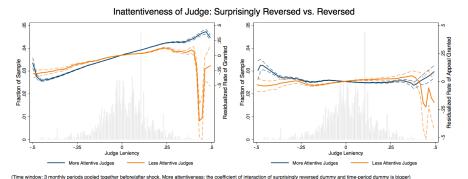

(Time window: 3 monthly periods pooled together before/after shock. More attentiveness: the coefficient of interaction of surprisingly reversed dummy and time-period dummy is bigger)

If judges are 'ordering' their asylees, the most lenient judge letting in the most applicants should be rejecting only the "least safe" applicants

Their appeal success should be lower, which we see among more attentive judges

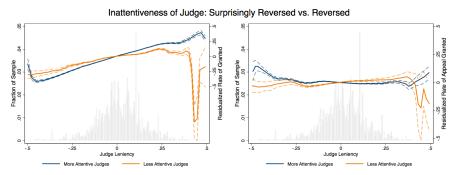

Right Figure: Assess implicit risk ranking

If judges are 'ordering' their asylees, the most lenient judge letting in the most applicants should be rejecting only the "least safe" applicants

Their appeal success should be lower, which we see among more attentive judges

.. but not less attentive judges

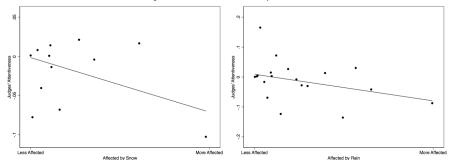

(Time window: 3 monthly periods pooled together before/after shock. More attentiveness: the coefficient of interaction of surprisingly reversed dummy and time-period dummy is bigger)

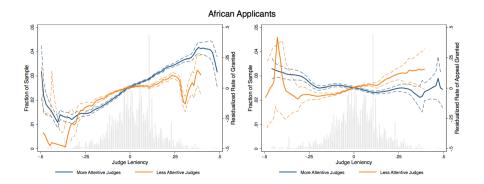

.. who may be more prone to other extraneous factors

.. such as weather

Judges' Attentiveness and Vulnerability to Weather

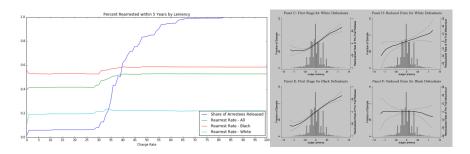

Difference in Indifference for asylees from the Global South

Judicial Inattention: Machine Prediction of Appeal Success

Using ML to Understand how Screeners Screen

Actually, flat for Whites, upward slope for Blacks (left)

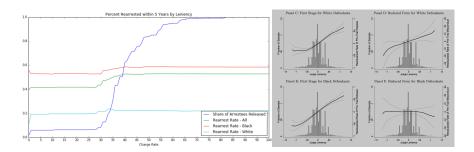

Algorithms as Prosecutors: Identifying Characteristics Noisy to Human Prosecutors

Judges released along "right" diagonal for Whites but not Blacks (right)

in Arnold, Dobbie, Yang, Quarterly J Econ 2017

Why "wrong diagonal" for Black defendants?

Using ML to Understand how Screeners Screen

Actually, flat for Whites, upward slope for Blacks (left)

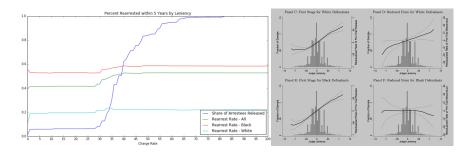

Algorithms as Prosecutors: Identifying Characteristics Noisy to Human Prosecutors

• Judges released along "right" diagonal for Whites but not Blacks (right)

in Arnold, Dobbie, Yang, Quarterly J Econ 2017

Why "wrong diagonal" for Black defendants?

Using ML to Understand how Screeners Screen

Actually, flat for Whites, upward slope for Blacks (left)

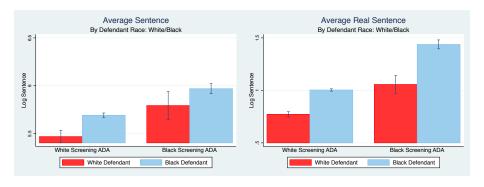

Algorithms as Prosecutors: Identifying Characteristics Noisy to Human Prosecutors

Judges released along "right" diagonal for Whites but not Blacks (right)

in Arnold, Dobbie, Yang, Quarterly J Econ 2017

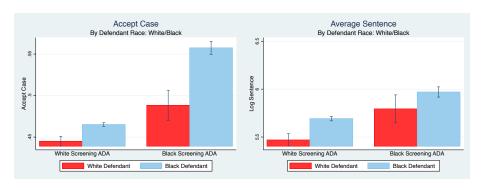

Why "wrong diagonal" for Black defendants?

1. Screening Increases Racial Sentencing Gap

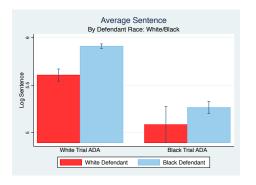

- Since black defendants are less likely to be declined, "real" racial disparity magnifies (on right)
 - Is statistical discrimination the reason for disparate screening?

2. White Prosecutors Screen-In Fewer Cases that result in Shorter Sentences

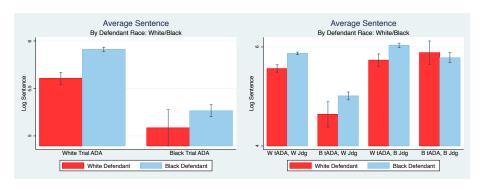

- White and black screeners let in different cases
 - If targeting the most severe ones, white screener cases should have longer sentences

3. White Trial Prosecutors Obtain Longer Sentences

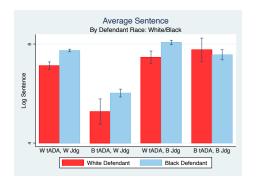

- Most District Attorneys are elected; want to appear tough-on-crime (Pfaff 2016)
- Why are white trial prosecutors more effective in this goal?

4. Black Trial Prosecutors + White Judges Render Shorter Sentences

- The difference seems attributeable to the interaction of hierarchy and race
 - ▶ Black trial prosecutors + Black judges render similar average sentences as White trial prosecutors do (on right)

5. Black Trial Prosecutors + Black Judges Eliminate or Reverse Racial Sentencing Gap

Hard to explain as statistical discrimination

Revealed Preference Indifference

Dynamic Point Sytems?

Apply sharing economy principles of low transaction costs, coordination of information networks and better resource allocation and utilization.

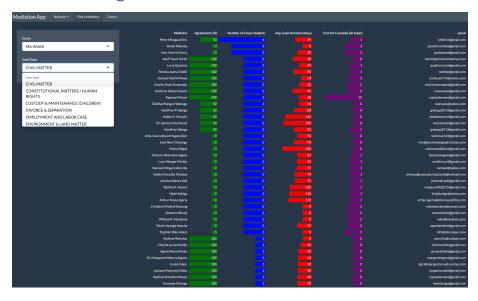

Legal Uber App

The web app will display a dashboard interface that allows the supply side user (clerk or judge) to view case availability. Case priority can be determined by how long the case has been idle and in which region it exists. These factors can influence not only the prioritization of a case but also the reward that is offered for taking the case. Participants can volunteer into an incentive scheme that allows them to earn points as they complete the cases. These points can then be spent on various rewards like access to interns, working from home allowance, flexible scheduling, and public recognition. Judges and clerks could also share schedules and professional details like their location and expertise with the system which can assist in determining their suitability for the platform.

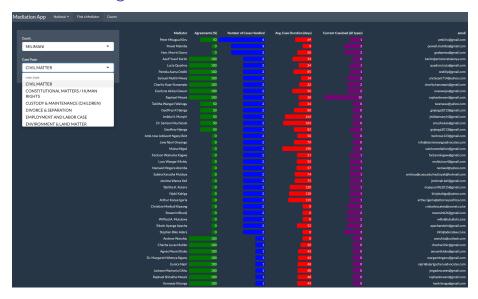

Improve performance in congested courts by balancing workload across courts, without incurring cost of hiring new staff.

- Policy discussion tends to revolve around having AI replace humans or suggest the optimal decision
- Consider instead an incremental approach based on Enlightenment and Romantic ideals of the self: self-knowledge, self-expression

Can Al improve decision-making? Babic, Chen, Evgeniou, and Fayard, Harvard Business Review 2020

- Cognitive science and psychology suggests that humans have limited and imperfect reasoning capacities (Tversky and Kahneman 1986; Eyster 2019)
- Gambler's fallacy, mood, time of day, order, ...
 - highlight fragility of courts
 - ★ "In a crowded immigration court, 7 minutes to decide a family's future" (Wash Post 2/2/14)
- Policy discussion tends to revolve around having AI replace humans or suggest the optimal decision
- Consider instead an incremental approach based on Enlightenment and Romantic ideals of the self: self-knowledge, self-expression

Can Al improve decision-making? Babic, Chen, Evgeniou, and Fayard, Harvard Business Review 2020

- Cognitive science and psychology suggests that humans have limited and imperfect reasoning capacities (Tversky and Kahneman 1986; Eyster 2019)
- Gambler's fallacy, mood, time of day, order, ...
 - highlight fragility of courts
 - ★ "In a crowded immigration court, 7 minutes to decide a family's future" (Wash Post 2/2/14)
- Policy discussion tends to revolve around having AI replace humans or suggest the optimal decision
- Consider instead an incremental approach based on Enlightenment and Romantic ideals of the self: self-knowledge, self-expression

Stage 1: Predicted Self

- In Stage 1, people use AI as a support tool, speeding up existing processes (for example, by prefilling forms)
 - ► An Al-based recommender system offers a decision-maker the best prediction of themselves, based on their previous decision-making, from a model using only legally relevant features X.
 - ★ assess judges vs. their predicted self
 - ▶ (1) Increase consistency across similar cases by offering the relevant reference points and cabining the influence of extraneous factors.
 - ▶ (2) Seeing the predicted self leverages self-image motives of pro-social decision-makers (Benabou and Tirole 2011).
 - ▶ (3) Deviating from defaults facilitates conscious deliberation.
- self-image (predicted self)

Stage 1: Predicted Self

- In Stage 1, people use Al as a support tool, speeding up existing processes (for example, by prefilling forms)
 - ► An Al-based recommender system offers a decision-maker the best prediction of themselves, based on their previous decision-making, from a model using only legally relevant features X.
 - ★ assess judges vs. their predicted self
 - ▶ (1) Increase consistency across similar cases by offering the relevant reference points and cabining the influence of extraneous factors.
 - ▶ (2) Seeing the predicted self leverages self-image motives of pro-social decision-makers (Benabou and Tirole 2011).
 - ▶ (3) Deviating from defaults facilitates conscious deliberation.
- self-image (predicted self)

Stage 2: Prediction of Error

- A deviation that is more likely to render an error (from a model using all available features X and W) can be accompanied by a nudge to "be more attentive" or spend more time to make a better decision.
 - ▶ (1) A nudge, instead of a checklist, might impose less bandwidth.
 - ▶ (2) Save time and energy to focus on novel, complex cases.
- self-improvement (nudges)

Stage 3: Explanations

- A decision-maker may want interpretable machine learning and request a reason for why the deviation may lead to mistakes.
 - ▶ (1) Stage 3 elevates the AI to the role of a more general coach, providing feedback on choices.
 - ▶ (2) The more people feel that their autonomy is protected and that they are in control of the conversation—able to choose when feedback is given—the better they respond to it. (West and Thorson 2018)
- self-understanding (why)

Stage 4: Dialogue

- Of course, it is always possible that the AI system's suggestion would not take into account some reliable private information that the decision-maker might have access to.
 - Where this happens, the AI system would be steering the decision-maker off course rather than correcting for their inconsistencies.
 - ► Therefore, a dialogue, encouraged between the decision-maker and the Al system, allowing for the Al to learn from the user as well.
- self-expression (autonomy)

Stage 5: Community of Experts

- Al brings in other people's decision histories and patterns, serving as a platform for a community of experts.
 - ► A decision-maker may want to access a community of experts by seeing what the algorithm predicts other to do.
 - This can be accessible as a dropdown menu, to seek advice from a particular decision-maker,
 - or as a statistical distribution to protect privacy.
- community of practice (self vs. others)

Stages 6+

- Stage 6, train novices
 - who tend to make more mistakes
 - experts can input a preferred decision
 - or use prediction if appealed
- Stage 7, open access for citizens
 - ▶ for transparency & accountability
- Stage 8, use feedback from dialogue stage as recommender system
 - with A|B testing to generate causal inference

Stages 6+

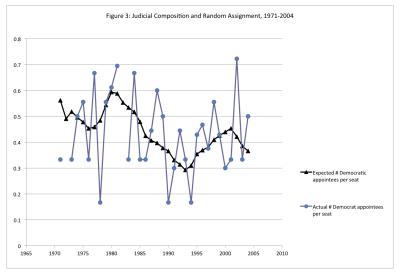

- Stage 6, train novices
 - who tend to make more mistakes
 - experts can input a preferred decision
 - or use prediction if appealed
- Stage 7, open access for citizens
 - for transparency & accountability
- Stage 8, use feedback from dialogue stage as recommender system
 - ▶ with A|B testing to generate causal inference

Stages 6+

- Stage 6, train novices
 - who tend to make more mistakes
 - experts can input a preferred decision
 - or use prediction if appealed
- Stage 7, open access for citizens
 - for transparency & accountability
- Stage 8, use feedback from dialogue stage as recommender system
 - ▶ with A|B testing to generate causal inference

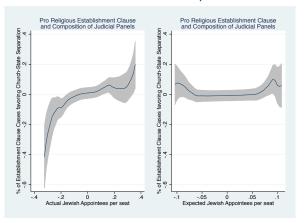

Randomization of cases already yields A|B testing

Decisions are not random, but judges are randomly assigned

In common law, judges set precedent for future judges to follow

Biographies Predict Church-State Separation

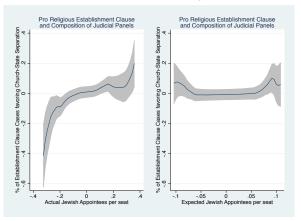

Minority religion judges prefer separate church and state

The Political Economy of Beliefs

$$\begin{cases} Law_{ct} = \alpha_{ict} + \phi Z_{ct} + \gamma_1 X_{ict} + \gamma_2 W_{ct} + \eta_{ict} \text{ (machine learning step)} \\ Y_{ict} = \alpha_{ict} + \rho Law_{ct} + \beta_1 X_{ict} + \beta_2 W_{ct} + \varepsilon_{ict} \text{ (causal inference step)} \end{cases}$$

Biographies Predict Church-State Separation

Chen, Chen, and Lewis; NeurIPS 2020 (ML for Policy)

Judicial state capacity as physical capital and human capital

• How Can We Train Judges and Civil Servants to Improve Rule of Law?

• How Can We Measure Legitimacy - Can Al help citizens be heard?

Do multilaterial organizations care about justice?

Al can increase access, efficiency, and fairness of justice, and reduce market-level constraints to economic development

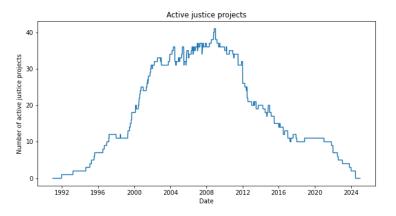

Decline in Justice Projects at the World Bank

Should we invest more in justice?

Do multilaterial organizations care about justice?

Al can increase access, efficiency, and fairness of justice, and reduce market-level constraints to economic development

Decline in Justice Projects at the World Bank Should we invest more in justice?

How Can We Train Judges to Improve Rule of Law?

- The training of public officials is one of the key dimensions governments use to improve bureaucratic performance
- For example, in 2017 alone, the U.S. allocated approximately 4% of its annual budget for personnel compensation and benefits, or around \$10 billion, towards training civil servants (Credibility Engine 2021; USA Spending)
- Despite its significance, there is limited empirical research on effective methods to improve the training of public officials using RCTs
- Particularly relevant in the judiciary, as slow and unreliable justice systems represent a key barrier to economic growth

How Can We Train Judges to Improve Rule of Law?

- The training of public officials is one of the key dimensions governments use to improve bureaucratic performance
- For example, in 2017 alone, the U.S. allocated approximately 4% of its annual budget for personnel compensation and benefits, or around \$10 billion, towards training civil servants (Credibility Engine 2021; USA Spending)
- Despite its significance, there is limited empirical research on effective methods to improve the training of public officials using RCTs

- Self-persuasion presentation to others

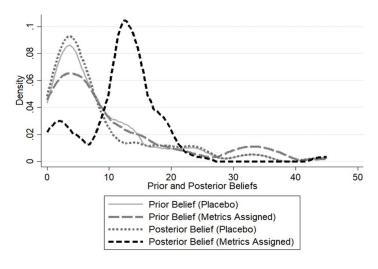

Metrics Training Increased Demand for Causal Evidence

Treated Policymakers Update Posterior Beliefs

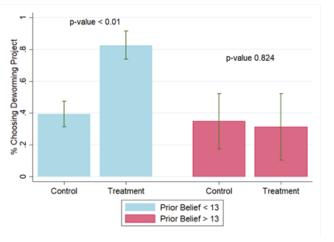

Increased Responsiveness to Causal Evidence

Treated policymakers' performance in national research methods and public policy exams improves and commissioning of RCTs in policy making increases

Metrics Training Impacts Deworming Project Choice

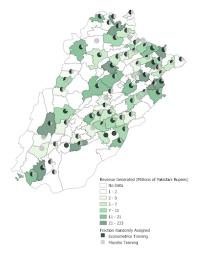

In their official duties, twice as likely to choose and triple funding for policies with RCT evidence

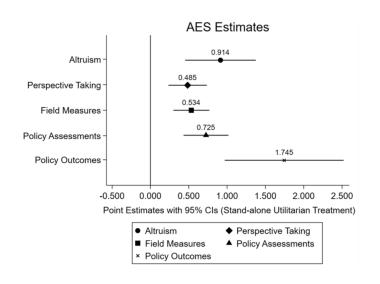

Especially if their prior beliefs were below the evidence from RCT

Metrics Training Improves Fiscal State Capacity

Econometrics education led to a 20% increase in the use of tax reminders and 40% increase in tax collection

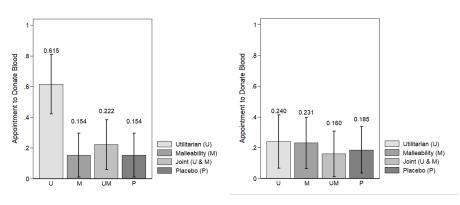

Randomizing schools of thought on cultivating prosociality Training effective altruism via the utilitarian value of empathy renders greater altruism

Blood Donations

Training effective altruism increased mentalizing on consequences of decisions

Blood donations doubled only for matching blood type

Perspective-taking in strategic dilemmas improved

Altruism in Action

Orphanage visits and volunteering increased. Amid official duties, ministers were more likely to choose social policies and recommended 4-fold funding for them

Setting

- Judicial Academy of Peru is working on the transition from theory to case-based teaching, which was already the primary method of teaching in American law schools since the 1970s (Moskovitz 1992).
- In this two-year engagement, we engaged in three randomized light-touch interventions.

Socratic Method (Study 1)

a pedagogical innovation from antiquity focusing on reflective inquiry

Socratic Treatment

 Socratic treatment encourages student to think critically - challenging their own as well as their teachers and classmates assumptions about the material covered in class.

THINK ABOUT THESE QUESTIONS

- 1. WHAT OPINIONS do you have about today's topic?
- 2. What ASSUMPTIONS are you making towards that opinion?
 - 3. During the class, are your assumptions proving TRUE or getting CHALLENGED?
- 4. WHEN are your assumptions the SAME as your classmates?
- 5. WHEN are your assumptions DIFFERENT from your classmates?

Control treatment reminded students to focus on the teacher's ideas and take notes

Socratic Training improved Performance

Students assigned to Socratic treatment were 2.6 percentage points more likely to pass and increased grades by 0.23 standardized units

 - Implies quadratic costs $\sum_{i=1}^{N} (v_i^j)^2 = B$

Quadratic Voting (QV) interface

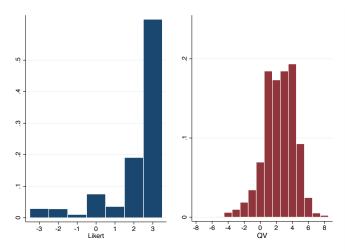

QV vs. Likert: Equal Pay

Do you favor or oppose requiring employers to pay women and men the same amount for the same work?

- With Likert, responses are strongly right-skewed
- With quadratic costs, less so

QV vs. Likert: Equal Pay

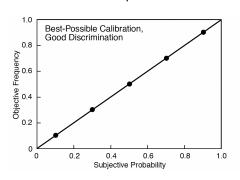

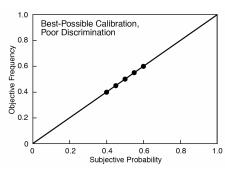

Do you favor or oppose requiring employers to pay women and men the same amount for the same work?

- With Likert, responses are strongly right-skewed
- With quadratic costs, less so

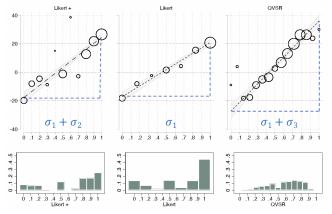

Calibration and Discrimination (Tetlock 2006)

predict behavior and explain variance

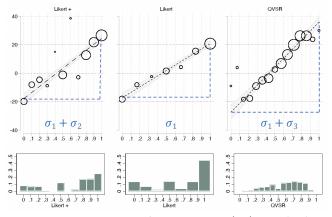

Who Cares Caville, Chen, and Van der Straeten, Political Science Research and Methods 2024 Laws making it more difficult for people to buy a gun

Y-axis: Donation, X-axis: Survey responses (0,1) normalized,
Circles size proportional to observations

- Likert (center) exhibits bunching, i.e. less ability to discriminate
- QVSR (right) exhibits variance in Y, i.e. greater ability to calibrate

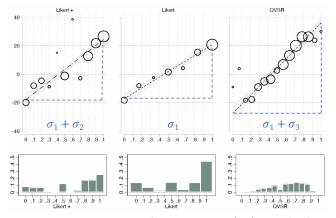

Who Cares Caville, Chen, and Van der Straeten, Political Science Research and Methods 2024 Laws making it more difficult for people to buy a gun

Y-axis: Donation, X-axis: Survey responses (0,1) normalized, Circles size proportional to observations

- More calibration with quadratic fit in lower panel (POTENTIALLY NON-LINEAR)

- Survey design often approximates a prediction problem: the goal is to select instruments (tools or questions) that best predict the value of an unobserved construct or a future outcome.
- Step 1: Build a prediction model using the survey responses and the demographic covariates
 - ► Track prediction error DONATION
 - Repeat for each survey method
 - Estimate "treatment" effect on the prediction error
- Step 2: Policy learning (Athey and Wager, 2021)
 - Maps covariates to a treatment that results in lowest prediction error

Budget Constraints

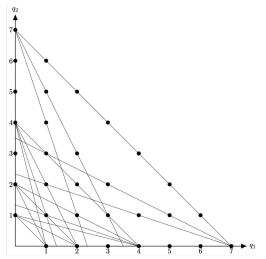

Figure: The horizontal axis represents a subject's answer to statement 1, while the vertical axis represents a subjects' answer to statement 2. The line represents the various budget constraints. Each point in the figure on a budget constraint represents a possible answer.

Graphic intuition

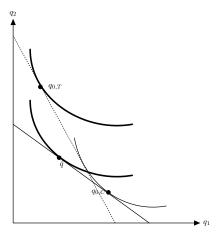

Figure: Recovering the counterfactual \hat{q} , which corresponds to the attitudes expressed by a hypothetical individual with the average preferences of the treated facing the shadow prices of the untreated.

Application

	(1) Conservative Overall effect	(2) Conservative Preferences	(3) Conservative Shadow budget	(4) Liberal Overall effect	(5) Liberal Preferences	(6) Liberal Shadow budget
Conservative treatment	1.709***	0.0654	1.643***			
Conservative treatment						
	(0.192)	(0.176)	(0.0779)			
Liberal treatment				1.281***	1.774***	-0.493**
				(0.313)	(0.241)	(0.200)
Mean dep. var.	8.164	8.164	8.164	4.735	4.735	4.735
Observations	323	323	323	339	339	339

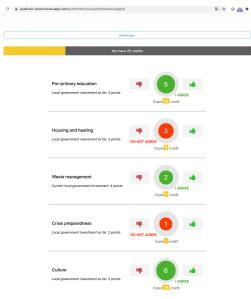

Robust standard errors in parentheses. The dependent variables for conservative and liberal treatments are conservative and liberal statements in Likert scale respectively. The overall effect of each treatment is decomposed into the effect due to the change in preferences and due to the change in shadow budget. In columns (1), (2), and (3), the sample considered includes all the subjects in the conservative treatment and in the control group. In column (4), (5), and (6), the sample considered includes all the subjects in the liberal treatment and in the control group. Subjects whose Likert scale answers correspond to a comer solution of the maximization problem are excluded.

Po-(5.**pc.1): ***pc.01: ***pc.01: **pc.01: **pc.01:

- **1** Exposure to the liberal preach makes subjects' \leq more liberal.
- 2 Exposure to the conservative preach increases the cost of disagreeing with a conservative opinion but does not fundamentally affect \leq .
